

ABSTRACT

There is provided a resin sheet that achieves improvement in lightweight,
low profile and high impact characteristics, suppresses thermal shrinkage and
5 expansion and is excellent in light transparency so as to prevent the display
quality or the like of a display device from being deteriorated, as well as a
substrate for a display device, a display device and a substrate for a solar cell, each
having the aforesaid resin sheet. A resin sheet includes a cured resin layer
containing in a resin a glass fiber cloth-like material and inorganic particles, and
10 is structured to have a haze value of 10% or lower.
